1. Sign up for a [bubble.io account here](). For the moment, a free account will give you everything you need to follow along.

2. You can copy the design template used in this tutorial by [clicking here](). From that page, click on the app's page name in the sidebar (i.e. crypto_app1) and then right click and select "copy to another app". Then from your own application, you can right click within your own sidebar and then click on "paste". Bubble will then prompt you to create a new page using this template.

After completing this step you'll get a few app error issues. That's simply because you'll need to copy a database type over from our app to yours as well. Go back to our template and click on the "database" icon in the left sidebar. Then with the "data type" tab selected, find the "crypto" data type and then hover over it and right click. Then click on "copy". Now, back in your own app, go to your database by clicking on the database tab. Again, with the data type tab selected hover right click on any data type you have in your database and right click. Next, click on "paste" and the crypto data type will be added to your application as well!

That's it!
